# Review and recap

Physics 211 Syracuse University, Physics 211 Spring 2019 Walter Freeman

April 29, 2019

### Announcements

Extra office hours and reviews ahead of the exam:

- Today, 4-8, Physics 208
- Tomorrow, 10-3, Physics 106
- Friday, 10-4, Link 114
  - Note: I am sick and have to sing a concert this weekend. If my voice gives out this review may be led by someone else or rescheduled; I'll do my best!
- This is a large amount of extra help for you please use it!

Homework 9 due today; no late penalties until Thursday.

If you forgot to turn in your paper, get on that:)

### Final exam format

- Biased toward Units 3 (conservation laws) and 4 (torque)
- Expect a focus on broad concepts, especially from Units 1 and 2
- Expect things like:
  - Sometimes/always/never questions
  - Positive/negative/zero questions
  - "I give you the solution; you point out the error"
  - Dimensional analysis/reasoning with units
  - Fermi problem

## Final exam format

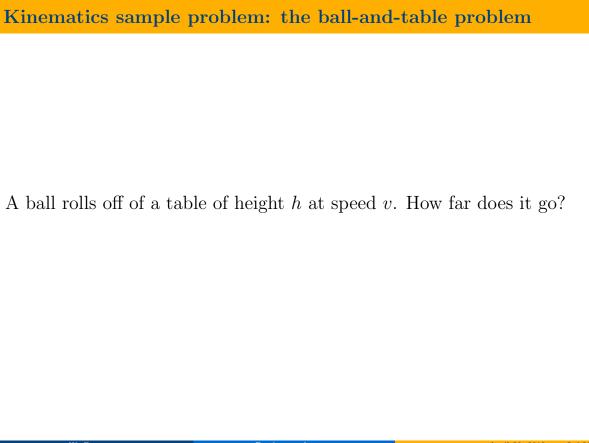

- Biased toward Units 3 (conservation laws) and 4 (torque)
- Expect a focus on broad concepts, especially from Units 1 and 2
- Expect things like:
  - Sometimes/always/never questions
  - Positive/negative/zero questions
  - "I give you the solution; you point out the error"
  - Dimensional analysis/reasoning with units
  - Fermi problem
- We will provide you the reference sheet for the exam; if there's anything you want on it, let me know!

# Kinematics concepts

- First derivative of position is velocity; second derivative is acceleration
- Kinematics lets us connect acceleration, velocity, position, and time
- If  $\vec{a}$  is constant:

$$s(t) = s_0 + v_0 t + \frac{1}{2}at^2$$
$$v(t) = v_0 + at$$
$$v_f^2 - v_0^2 = 2a\Delta x$$

- These relations hold separately and independently in x and y
- $\bullet$  Acceleration is g downwards if and only if an object is in freefall

## Use kinematics when:

• You need to connect some combination of position, velocity, acceleration, and time

# Force concepts and Newton's second law

- Newton's second law relates the net force  $\sum \vec{F}$  to the acceleration  $\vec{a}$  of the center of mass of an object
- If an object both rotates and moves,  $\vec{F} = m\vec{a}$  gives you  $\vec{a}$  of the center of mass
- Newton's third law: forces come in pairs
- Some forces you should know about:
  - Normal forces: as big as they need to be
  - Friction:  $F_{\text{fric,static,max}} = \mu_s F_N$ ,  $F_{\text{fric,kinetic}} = \mu_k F_N$
  - Traction: a type of static friction, points in direction chosen by the vehicle
  - Elastic:  $F = -k\Delta x$
  - Gravity (Earth): F = mg downward
  - Gravity (general):  $F = \frac{Gm_1m_2}{r^2}$
  - Tension: A rope pulls on both ends

# Force diagrams

- Draw all forces acting on the object, as vectors
- If you're going to care about torque, draw the whole object and draw the forces where they act
- Gravity acts at the center of mass
- Draw these diagrams big enough that you can read them clearly and do trig

## Uniform circular motion

- If an object is traveling in a circle, you know its acceleration is  $a_c = \omega^2 r = \frac{v_T^2}{r}$  toward the center
- Often this will "give you" the right side of F = ma, and let you conclude something about the left

## Use Newton's second law when:

- You need to connect the forces on an object to its acceleration
- If you don't need  $\vec{a}$  directly, and don't care about time, maybe use energy methods instead?

What angular frequency is required to make the eraser not fall?

# The work-energy theorem and conservation of energy

- Work-energy theorem comes from the third kinematics relation
- Two formulations, one with potential energy and one without:
  - $KE_i + W_{\text{all}} = KE_f$
  - $KE_i + PE_i + W_{other} = KE_f + PE_f$
- Draw *clear* before and after snapshots
- Figure out work done in going from one to the other
- Work =  $\vec{F} \cdot d\vec{s}$

# Use energy methods when:

- You don't know and don't care about time
- You can account for the work done by all forces involved
- This is **not** true at the instant of a collision use momentum instead

# Sample problem: energy

A ball rolls down a hill of height h and across a table. How fast is it moving at the edge of the table?

## Conservation of momentum

- $\bullet$  In the absence of external forces,  $\vec{p}=m\vec{v}$  is conserved
- This is a consequence of Newton's third law
- Collisions and explosions are short enough that external forces are small
- $\bullet$  Momentum is a vector and is conserved separately in x and y

# Use conservation of momentum when:

• You have a collision or explosion and need to connect the velocities before to the velocities after

## Rotation

# Many ideas here, most analogous to translational motion:

- Torque plays the role of force:  $\tau = F_{\perp}r = Fr_{\perp}$
- Moment of inertia plays the role of mass:  $I = \lambda mr^2$
- $\vec{F} = m\vec{a} \rightarrow \tau = I\alpha$ : "Newton's second law for rotation"
- Rolling motion is translation plus rotation:  $v = \pm \omega r$ ,  $a = \pm \alpha r$
- You must think about the signs here
- Rotational kinetic energy:  $KE_{\rm rot} = \frac{1}{2}I\omega^2$
- Angular momentum:  $L = I\omega$

# Static equilibrium problems

- Net torque is zero about any pivot
- Net force is zero (you may not need this)
- Torque due to any force applied at the pivot is zero

April 29, 2019

# The process of science

## Properties of scientific thought:

- Empiricism: science relies on the natural world itself as the only true authority
- Self-skepticism: people making scientific claims should search for and engage with potentially refuting evidence
- Universality: the laws of nature apply everywhere and everywhen, and to all things equally
- Objectivity: scientific ideas are independent of any particular human perspective

## Ways that this can go wrong:

- Cherry-picking
- Arguments ad hominem ("they're wrong because they're ugly") or from authority ("they're right because they have a fancy degree")
- Bad statistics / publication bias
- Ignoring refuting evidence
- Manufactured controversy
- Arguments from sensationalism ("XYZ is true because it's exciting")
- ... and others

### Final reminders

- Huge amounts of extra review available; use it
- Get some rest during finals week and take care of yourselves
- If you're affected by the Calc/Physics exam scheduling nonsense, tell SU!

# The power of mechanics

The things we've studied in this class are more powerful than you think. If you call up a chemist, she'll tell you the approximate force law between two noble gas atoms:

$$F(r) = \frac{\alpha}{r^{12}} - \frac{\beta}{r^6}$$

Review and recap

Put this into a computer and let it go:

# The power of mechanics

The things we've studied in this class are more powerful than you think. If you call up a chemist, she'll tell you the approximate force law between two noble gas atoms:

$$F(r) = \frac{\alpha}{r^{12}} - \frac{\beta}{r^6}$$

Put this into a computer and let it go:

We can understand freezing, melting, and boiling just with  $\vec{F} = m\vec{a}!$  ... we can even get the ideal gas law for free along the way!

# The rest of physics

The other disciplines of physics are variants on what you've learned already:

- Electromagnetism (PHY 212) introduces a new force just another  $\vec{F}$
- All you'll do in that class is apply the work-energy theorem and so on to this new force
  - Light is just a particular manifestation of that force
- Statistical mechanics uses statistics to understand  $\vec{F}=m\vec{a}$  acting on a great many particles at once
- Relativity mixes up space and time, changing the coordinates on us
- Quantum mechanics mixes up "particle" and "wave"

Each of these disciplines is supported by a "three-legged stool":

- Theory: understanding principles and using pen and paper to study them in simple situations (this class)
- Experiment: designing tests for these principles and building machines to carry them out (221)
- Computation: using computers to simulate those principles in more complicated situations and study their consequences (my field and class in the fall)

22 / 28

Like what you've done here? We have multiple options for you to study more physics!

You could get a physics minor. This involves:

- Physics 211 (you have this now!)
- Physics 212 (you will probably take this next semester!)
- Four more classes at the 300 level of your choice. For instance:

Review and recap

- Biophysics: the physics of living things how do cells do what they do?
- Cosmology: the history and future of the Universe!
- Astrophysics
- Computational physics (my class in the fall all of you are qualified!)
- Modern physics (quantum mechanics, relativity, atoms)
- Waves and vibrations: light and sound
- Advanced laboratory
- ... and others I'm forgetting!

... or maybe you want to be a physics major! (Come to the dark side – we have both cookies and the cheat-codes to the Universe!)

## Bachelor of Arts

This degree program prepares you for jobs in industry, and is also a great double major option with engineering, computer science, education, and all sorts of things:

- Physics 211/212
- 300-level class on modern physics (quantum mechanics, relativity, atoms the good stuff!)
- 300-level lab class
- 5 more elective classes (astrophysics, computational physics, biophysics, cosmology... lots of stuff)
- 30 physics credits total (you have four, plus four if you took AST101)

## Bachelor of Science

This degree program prepares you for the most technically demanding industry jobs, as well as graduate study in physics or related fields. It is also a good double major option for other STEM fields, in particular engineering (there are overlaps in the required classes)

- Physics 211/212
- 300-level class on modern physics (quantum mechanics, relativity, atoms – the good stuff!)
- 300-level lab class
- Rigorous courses in computational physics, electromagnetism, quantum mechanics, thermodynamics, and others
- 39 physics credits total (you have four now!)

If you've done reasonably well in this course, and have strong communication skills, Physics 211 wants to offer you a job!

We're always looking for good people to work for us as coaches in future years. Want to help next year's class, have fun, earn some money, and get a job that looks great on your resume?

If you've done reasonably well in this course, and have strong communication skills, Physics 211 wants to offer you a job!

We're always looking for good people to work for us as coaches in future years. Want to help next year's class, have fun, earn some money, and get a job that looks great on your resume?

Come talk to us!

## And, finally...

... thank you all; you have been an absolutely wonderful class. You've done challenging things, learned a vast amount, and I'm proud of all of you.

## And, finally...

... thank you all; you have been an absolutely wonderful class. You've done challenging things, learned a vast amount, and I'm proud of all of you.

"Science is the belief in the ignorance of experts." (R. Feynman)

# And, finally...

... thank you all; you have been an absolutely wonderful class. You've done challenging things, learned a vast amount, and I'm proud of all of you.

"Science is the belief in the ignorance of experts." (R. Feynman)

"All science is either physics or stamp collecting." (E. Rutherford)

April 29, 2019

I leave you with two quotes...

## I leave you with two quotes...

"A poet once said, 'The whole universe is in a glass of wine.'... [I]f we look at a glass of wine closely enough we see the entire universe. There are the things of physics: the twisting liquid which evaporates depending on the wind and weather, the reflection in the glass; and our imagination adds atoms. The glass is a distillation of the earth's rocks, and in its composition we see the secrets of the universe's age, and the evolution of stars. What strange array of chemicals are in the wine? How did they come to be?... If our small minds, for some convenience, divide this glass of wine, this universe, into parts – physics, biology, geology, astronomy, psychology, and so on – remember that nature does not know it! So let us put it all back together, not forgetting ultimately what it is for. Let it give us one more final pleasure; drink it and forget it all!"

27 / 28

## I leave you with two quotes...

"A poet once said, 'The whole universe is in a glass of wine.'... [I]f we look at a glass of wine closely enough we see the entire universe. There are the things of physics: the twisting liquid which evaporates depending on the wind and weather, the reflection in the glass; and our imagination adds atoms. The glass is a distillation of the earth's rocks, and in its composition we see the secrets of the universe's age, and the evolution of stars. What strange array of chemicals are in the wine? How did they come to be?... If our small minds, for some convenience, divide this glass of wine, this universe, into parts – physics, biology, geology, astronomy, psychology, and so on – remember that nature does not know it! So let us put it all back together, not forgetting ultimately what it is for. Let it give us one more final pleasure; drink it and forget it all!"

"Poets say science takes away from the beauty of the stars – mere globs of gas atoms. Nothing is "mere". I too can see the stars on a desert night, and feel them. But do I see less or more? The vastness of the heavens stretches my imagination – stuck on this carousel my little eye can catch one-million-year-old light. A vast pattern – of which I am a part... What is the pattern, or the meaning, or the why? It does not do harm to the mystery to know a little about it. For far more marvelous is the truth than any artists of the past imagined!"

-Richard Feynman, from Lectures on Physics

Thanks for a wonderful semester!
